EqualPath Testing Report

Local PostgreSQL Edition

Test date: 15 October 2026
Branch: feat/local-postgres
Commit: 6e17985

This report explains what was tested, how it was tested, and what the results mean. It uses simple English and keeps the professional testing terms. The report covers Unit Testing, Integration Testing, System Testing, and Acceptance Testing.

1 Executive Summary

The local EqualPath application passed the available automated checks and local database checks. The website also loaded on the local computer and showed the privacy notice and childcare search screen. No production website was changed during this test round.

Area	Result	Evidence
Unit Testing	PASS	398 automated Node tests passed.
Integration Testing	PASS	PostgreSQL import checks, API parity checks, and 2 exporter tests passed.
System Testing	PASS with limits	Local website loaded and the main local journey was checked. External map services are not fully local.
Acceptance Testing	READY FOR USER SIGN-OFF	The main parent journey meets the listed acceptance criteria in the local build. Formal stakeholder sign-off is still required.

Overall result: the branch is suitable for local review. It is not a production release approval and it is not a fully offline map system.

2 Four Testing Levels

Level	Meaning	Main question	Typical owner
Unit Testing	Tests one small function or module in isolation.	Does this function work?	Developer
Integration Testing	Tests the connection between modules, the API, the database, or another service.	Do the connected parts work together?	Developer or QA tester
System Testing	Tests the complete application as one system.	Does the whole application work?	QA tester
Acceptance Testing	Tests whether the product meets user needs and acceptance criteria.	Can the user accept and use the product?	User, product owner, or client

This order follows the common testing hierarchy described by the ISTQB glossary. Acceptance Testing focuses on user needs and acceptance criteria. Integration Testing focuses on interactions between components or systems. System Testing checks the system as a whole.

3 Test Scope and Environment

Item	Value
Application	EqualPath childcare discovery web application
Branch	feat/local-postgres
Commit	6e17985
Database	Local PostgreSQL database on a private Unix socket
Website URL	http://127.0.0.1:4180
Data	3,539 catalogue rows, 11,501 review rows, 8,121 evidence rows, 98 photo rows
Images	276 local JPEG files and 282 photo associations
Runtime	Node.js, Python, PostgreSQL, Vite, React
Test date	15 October 2026

The local mode does not use Appwrite for search data or images. Map tiles, address lookup, and road routing still use external services, so those parts need an internet connection. The cloud Telegram enquiry experiment is disabled in local mode.

4 Unit Testing

Unit Testing checks small pieces of code without testing the full website. The test command was `npm test`.

Test ID	Test area	Expected result	Actual result	Status
UT-001	Age and admission rules	Age ranges are checked correctly.	All related tests passed.	PASS
UT-002	Care hours and eligibility	Invalid or conflicting hours are not accepted as confirmed.	All related tests passed.	PASS
UT-003	Provider and review logic	Provider data and review profiles keep the correct keys.	All related tests passed.	PASS
UT-004	Comparison and recommendation logic	Comparison sorting and recommendations follow the defined rules.	All related tests passed.	PASS
UT-005	Local enquiry and chat rules	Answers stay within listed childcare facts.	All related tests passed.	PASS
UT-006	Full Node test suite	No unit test fails.	398 passed, 0 failed.	PASS

Command used: `npm test`

Result: 398 tests passed, 0 failed, 0 cancelled, and 0 skipped.

5 Integration Testing

Integration Testing checks the connections between the website, the local API, PostgreSQL, prepared runtime documents, and image files.

Test ID	Connection tested	Expected result	Actual result	Status
IT-001	Import scripts and PostgreSQL	The local database starts and source data imports.	`npm run local:setup` started the isolated database and loaded the snapshot.	PASS
IT-002	PostgreSQL and runtime store	The API reads the same prepared data as the website snapshot.	Runtime parity check passed in the verified local run.	PASS
IT-003	Database rows and source snapshot	Imported fields and counts match the bundled snapshot.	Verification checks passed for all imported fields.	PASS
IT-004	Photo records and	Every linked file has	276 JPEG files and	PASS

	local files	the expected path, size, and SHA-256 hash.	282 associations passed the hash checks.	
IT-005	Exporter regression checks	Capped totals and duplicate IDs are handled safely.	2 Python tests passed.	PASS
IT-006	API health and review lookup	Health and review requests return valid data.	The local API health and review checks passed in the verified run.	PASS

Commands used: `npm run local:setup`, `npm run local:test`, and `python3 -m unittest discover -s database/postgres/tests -p "*_test.py"`.

6 System Testing

System Testing checks the complete local website from the user interface. The local page loaded at `http://127.0.0.1:4180/#discover`. The current build showed the search form, local map area, privacy notice, and the main navigation.

Test ID	User flow	Expected result	Observed result	Status
ST-001	Open local website	The page loads without a server error.	EqualPath loaded on localhost.	PASS
ST-002	Privacy notice	The notice explains local browser data and can be acknowledged.	Privacy notice was visible with OK and Read the privacy notice actions.	PASS
ST-003	Search childcare	The user can provide location, date, age, and care hours.	Search controls were visible and usable in the local browser verification.	PASS
ST-004	Provider details	The user can see provider facts, fees, hours, and evidence.	Provider details were opened in the verified local journey.	PASS
ST-005	Reviews and photos	The user can read reviews and view local photo files.	Reviews and photo switching were checked in the verified local journey.	PASS
ST-006	Compare centres	The user can compare more than one centre.	Comparison was opened and showed centre columns in the verified local journey.	PASS
ST-007	External map and routing	Map and routing work with available internet services.	These services are external; some route times may be unavailable.	LIMITED

System result: PASS for the local application journey, with a LIMITATION for external map, geocoding, and routing services. The local website must not invent a road time when the routing service is unavailable.

7 Acceptance Testing

Acceptance Testing checks the product from a parent or stakeholder point of view. This section uses the approved parent journey and its acceptance criteria.

Test ID	Acceptance criterion	Result	Status
AT-001	A parent can enter a starting location.	The local search form provides a location field and map option.	PASS
AT-002	A parent can select child age and care time.	The search form provides date, children, start, and end controls.	PASS
AT-003	The system shows suitable centres.	The local runtime contains a short-care provider pool and returns results.	PASS
AT-004	A parent can view fees, hours, reviews, and photos.	Provider details include these data areas and local image files.	PASS
AT-005	A parent can compare centres.	The comparison view accepts selected centres and shows comparison fields.	PASS
AT-006	The parent has enough information to make a decision.	The application shows evidence labels and reminds the parent to confirm details with the centre.	PASS
AT-007	A stakeholder formally accepts the product.	No stakeholder sign-off was recorded in this test run.	PENDING

Acceptance result: READY FOR USER SIGN-OFF. The local build meets the listed functional criteria in the tested journey, but a product owner or client must still record the final acceptance decision.

8 Defects, Limits, and Risks

ID	Issue or limit	Impact	Action
L-001	Map tiles, address lookup, and road routing are external services.	The application is not fully offline.	Keep the internet connection for map features and show unavailable route times when needed.
L-002	The local PostgreSQL database is a development database.	It is not a production backup or public server.	Use `npm run local:setup` and keep the database on the local machine.
L-003	Raw source table edits do not rebuild prepared runtime documents automatically.	A manual refresh is needed after changing source data.	Run the approved import and verification process before testing again.
L-004	Formal stakeholder acceptance has not been recorded.	The product cannot be called finally accepted.	Ask the product owner or client to complete the sign-off row in Section 7.

9 How to Reproduce the Tests

From a new device, install Git, Node.js 22+, Python 3.10+, and PostgreSQL 16 or newer. Clone the `feat/local-postgres` branch, then run:

```
npm ci
npm run local:setup
npm run local:verify
npm test
python3 -m unittest discover -s database/postgres/tests -p "*_test.py"
npm run local:start
```

Open `http://127.0.0.1:4180`. Record screenshots and actual results in the test tables. Stop the local database with `npm run local:stop`.
